

FOXTM

Premium Threaded Connections

JFE Steel Corporation

FOX™ is an advanced premium threaded connection which has been jointly developed by JFE STEEL CORPORATION and HUNTING OILFIELD SERVICES. JFE STEEL CORPORATION has over seventy years experience in steel production, and provides proprietary JFE-series OCTG for sour service, low temperature service and hi-collapse service, in addition to API grades. HUNTING OILFIELD SERVICES has over twenty-five years experience in the design, manufacture and technical field service of connections for OCTG. Together, we have designed a connection which uses innovative design concepts to overcome problems found in conventional premium connections. Advanced thread geometry, a unique seal design and innovative gauging techniques combine to reduce thread galling and enhance sealing performance.

FOX™ has been field-proven around the world.

COVER: Graphic shows distribution of equivalent plastic strain around seal when made up with finite element analysis.

1. FOX™ CONNECTION: DESIGN FEATURES

BUTTRESS TYPE THREAD WITH PITCH CHANGE

reduces peak tooth load and improves load distribution

CONTOURED METAL-TO-METAL SEAL

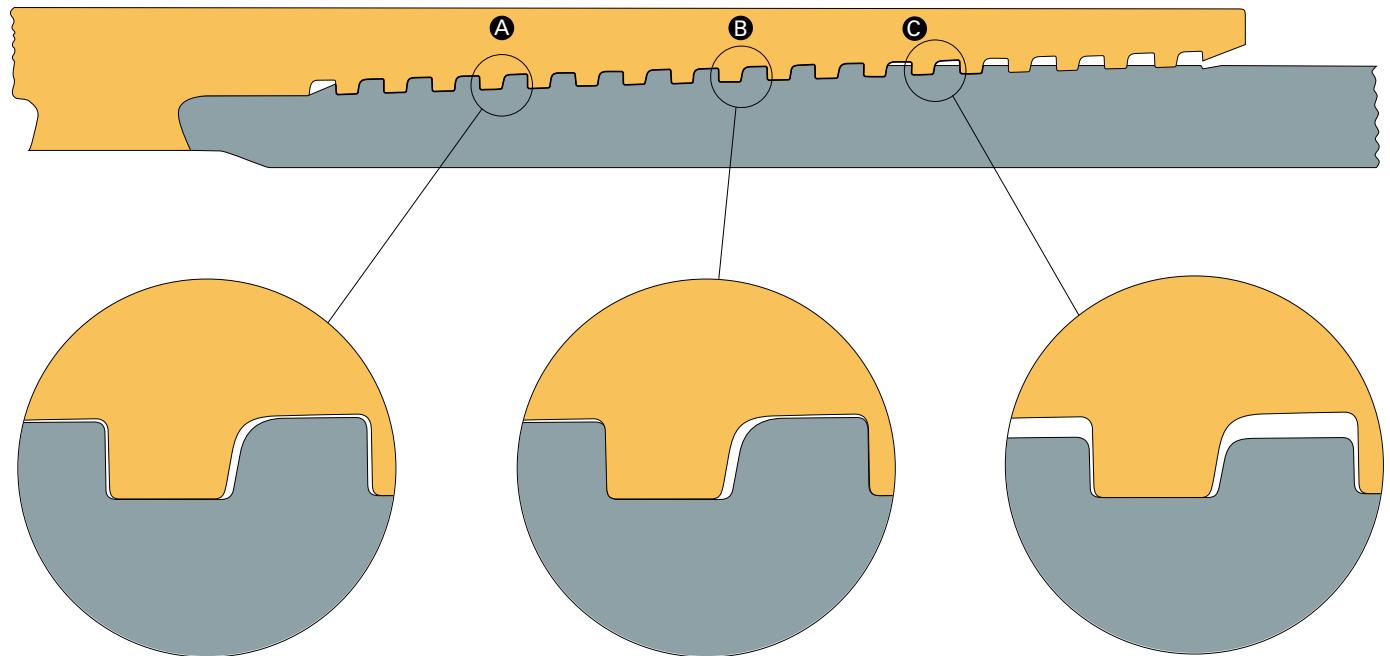

reduces stress concentration and ensures excellent sealability

INTERNAL FLUSH DESIGN (Tubing)

enhances flow efficiency and corrosion resistance

DESIGN FEATURE	EFFECT	IMPROVEMENT
THREAD PITCH CHANGE	<ol style="list-style-type: none"> 1. Reduction of maximum tooth load 2. More even tooth load distribution 	<ol style="list-style-type: none"> a. High resistance to thread galling b. Good control of make-up c. High resistance to back off d. High resistance to coupling bellringing and unzipping e. Increased fatigue life
METAL-TO-METAL TRIPLE RADIUS SEAL	<ol style="list-style-type: none"> 1. Localized high sealing pressure 2. Reduced stress concentration 	<ol style="list-style-type: none"> a. Ensure excellent sealability b. Reduce shoulder damage c. High resistance to over-torquing d. High resistance to seal galling
INTERNAL FLUSH	<ol style="list-style-type: none"> 1. Reduction of turbulence 	<ol style="list-style-type: none"> a. Enhanced resistance to corrosion b. High flow efficiency

2. THE FOX™ PITCH CHANGE CONCEPT

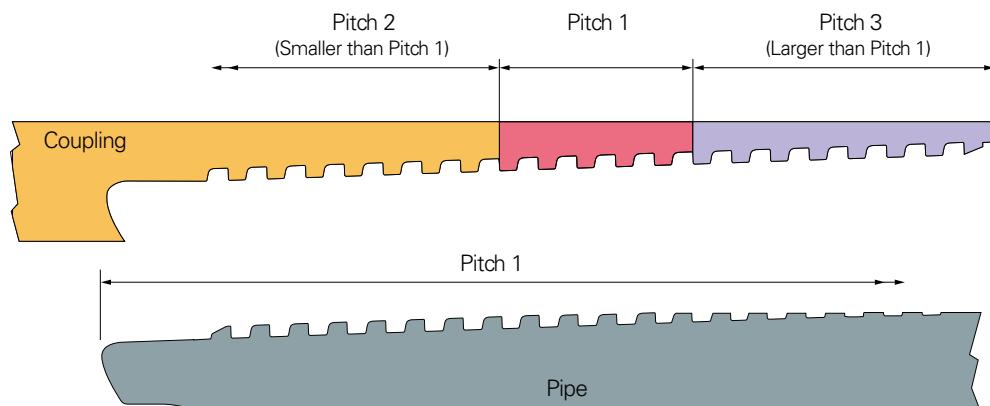

A The gap between load flanks closes as the joint is made up to torque condition.

B The standard pitch area acts to concentrate loads in the center section of the thread.

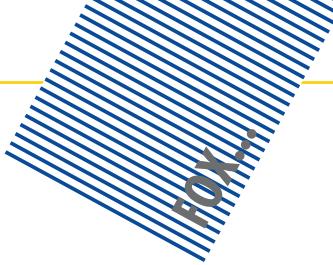

C The gap between load flanks on initial assembly closes as the joint is axially loaded in tension.

DOUBLE PITCH CHANGE

The pin member retains a standard pitch over its entire length. The box member features three section, each having a different pitch: increased pitch (in relation to the pin) in the outer part of the box, standard pitch in the center section, and reduced pitch in the inner section. This produces gaps at the load-bearing flanks of the threads in the inner and outer regions of the thread prior to make-up and running.

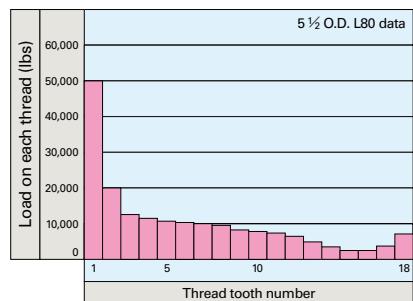

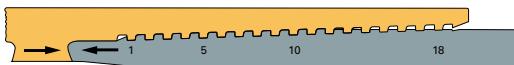

The gaps between the load-bearing flanks of the threads are closed by make-up torque and by the axial load imposed by pipe weight. Threads are preferentially loaded in the center of the connection, with reduced loads in the inner and outer sections. The risk of thread galling is reduced by the lower level of radial thread interference in the FOX™ connection in comparison to other designs.

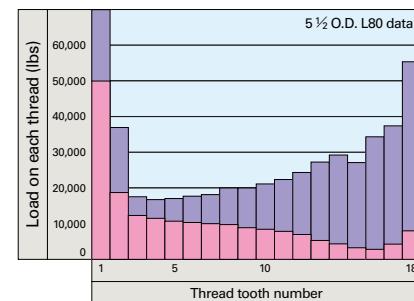

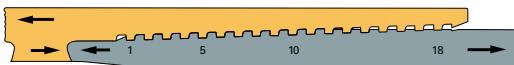

3. SUPERIOR LOAD DISTRIBUTION

TYPICAL PREMIUM CONNECTION

•Make-up only

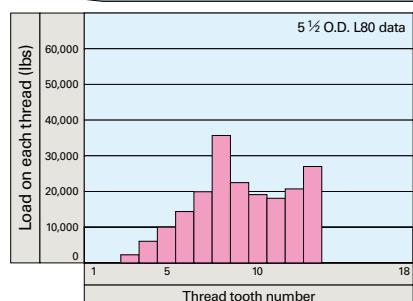

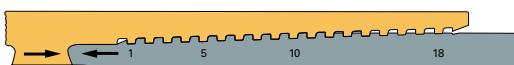

•Make-up plus axial tension

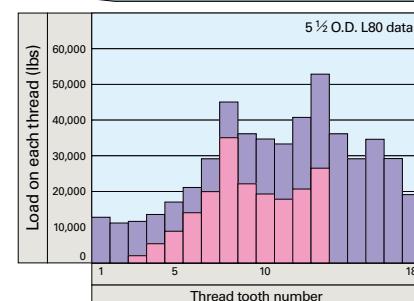

FOX™ PREMIUM CONNECTION

•Make-up only

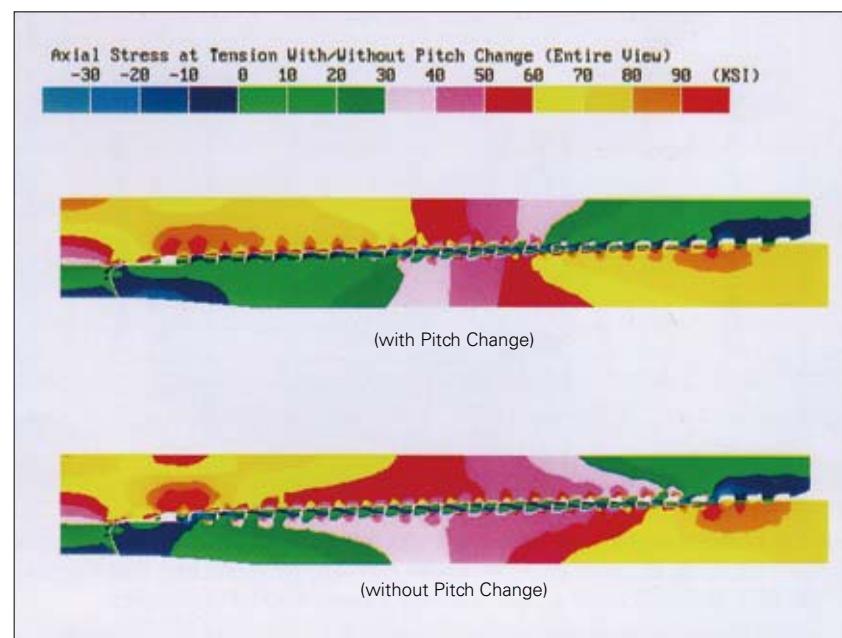

•Make-up plus axial tension

4. F.E.A. MODELS

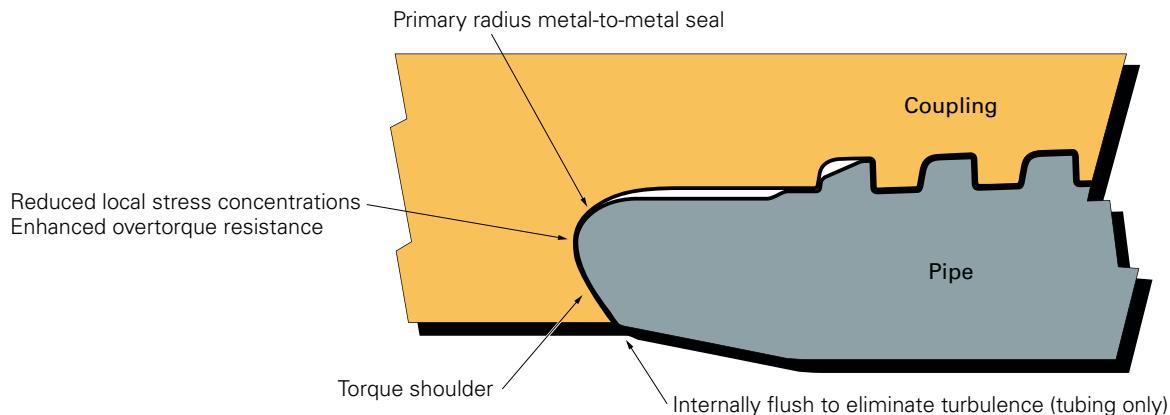

Two FEA graphics show the difference in axial stress distribution with and without pitch change.

The pitch change concept, which is one of the main features of the FOX™ design, works to give more even load distribution on each thread.

5. THE TRIPLE RADIUS SEAL CONCEPT

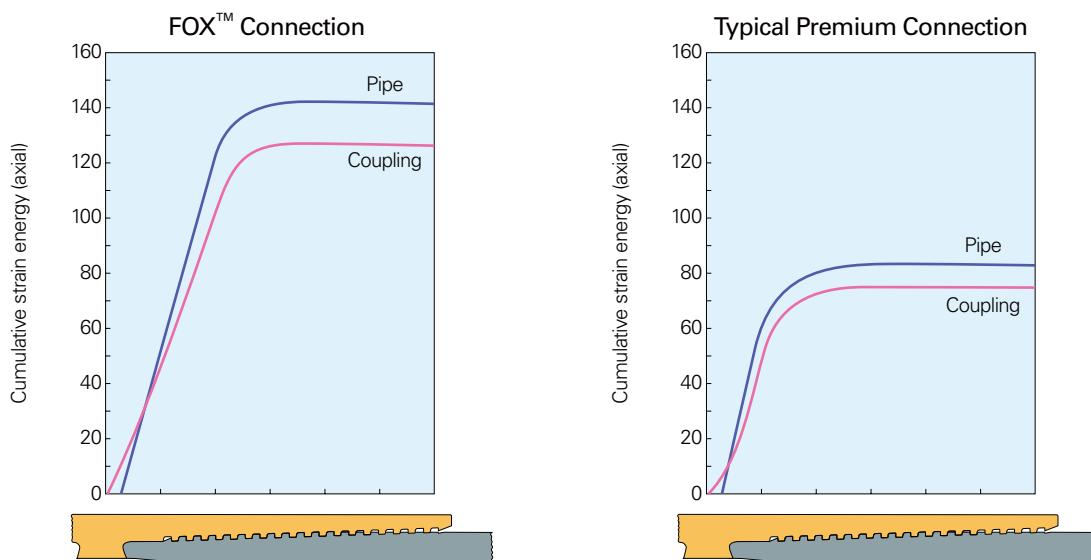

The triple radius seal used in the 'FOXTM' connection comprises a pin seal feature having a profile of three interacting radii engaging with a corresponding sealing surface profile in the coupling. Because of the generous blending radius which this design allows, there is a reduced local stress concentration giving better resistance to over torquing and fatigue.

The smooth, continuous profile of the FOXTM triple-radius seal improves sealing performance, reduces stress concentrations and provides for increased overtorque resistance.

A more gradual lead-in during make-up is achieved compared with the conventional double taper design, and the principle of tri-axial compression is included. Sealing is achieved as a result of combined radial and axial compression of the pin end. The smooth interior pin to coupling profile produces internally flush bores for tubing applications, maximizing bore diameter and reducing turbulence.

COMPARISON OF SEAL STORED ENERGY

Plots of strain energy induced in the pin and coupling for both a conventional and the FOXTM connections were obtained from the finite element analysis. These confirm the prediction that the strain energy stored across the metal-to-metal seal for the FOXTM is significantly greater than for a conventional connection.

6. GAUGING TECHNIQUES

Electronic Gauging

As part of the FOX™ development program, the FOX™ development team addressed problems of conventional thread gauging, and devised a new electronic gauging technique. The gauge measures stand-off, taper, seal diameter and lead of pin and box thread at a resolution of one micron. The measurements are analysed by a data processing unit, which is able to mathematically compensate for pipe ovality on the basis of measurement data. The electronic gauging process reduces the wear problem associated with hard gauging, and enables an individual data record to be retained for every FOX™ connection.

Pin Taper Seal Gauge

Data Processing Unit

Mechanical Gauging

Conventional taper, lead and thread height gauges may also be used in gauging of FOX™ connections, in such forms as go/no-go gauges.

MRP Gauge

To measure thread diameter.

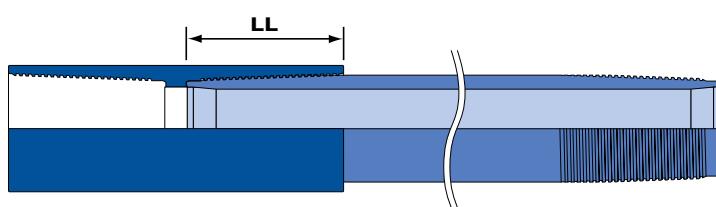

Thread Form Gauge

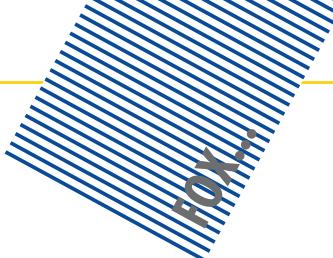

Go/No-Go Gauge to inspect thread form.
